Sample 3D model reconstruction

Activity 2 - Rapid Biodiversity Assessment

Study Sites for Rapid Biodiversity Assessment

PPSRNP (12 days)

- Sitio Calaga, and Panablan, Marufinas - March 11 to 22, 2022

CNCH (Cleopatra's Needle KBA) (13 days)

- Sitio Kalakwasan, Tanabag - March 29 to April 5, 2022
- Sitio Mangapin, Langogan - April 7 to 11, 2022

Roxas (Cleopatra's Needle KBA) (7 days)

- Sitio Kayasan, Nicanor Zabala, Roxas - April 23 to 29, 2022

Sampling Effort for Rapid Biodiversity Assessment

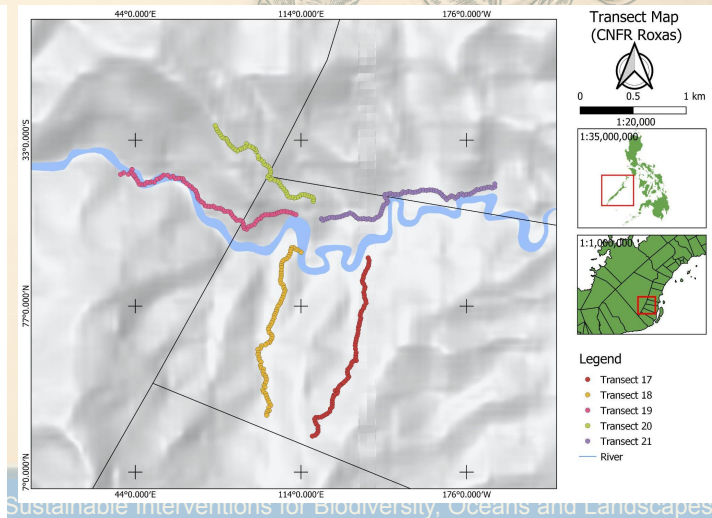

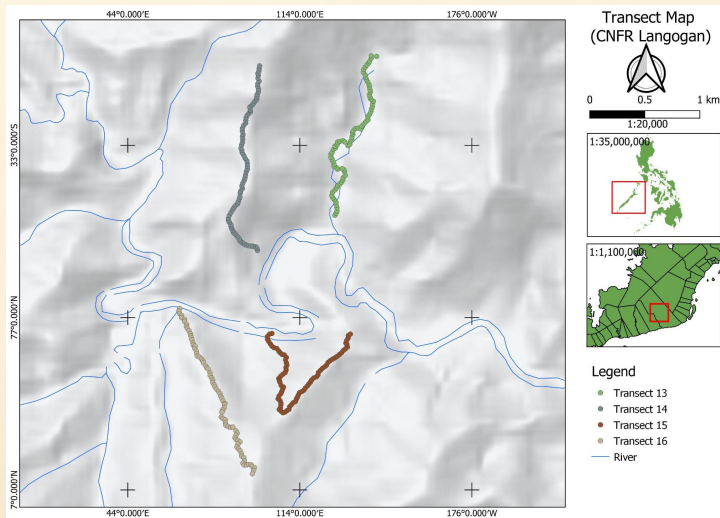

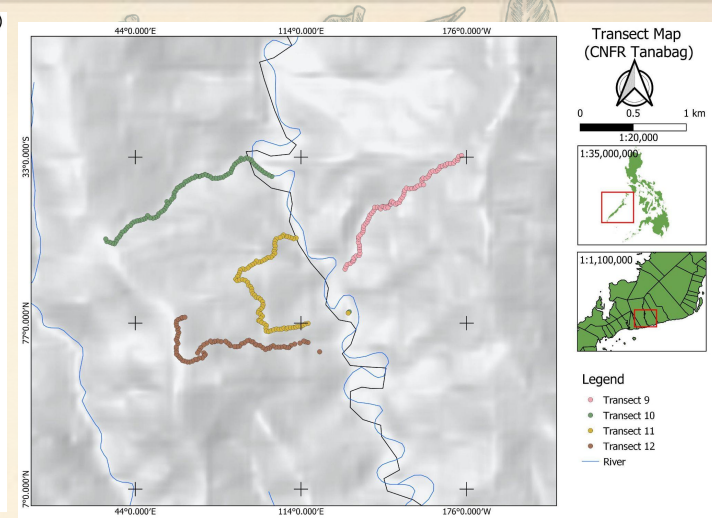

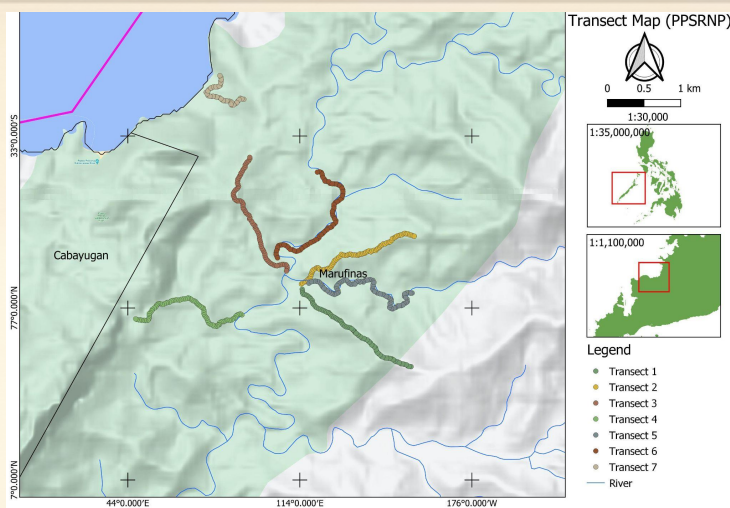

Overall effort = 21 2-km biodiversity transect lines
(coverage = 40 km or 320 ha)

Effort per taxonomic group

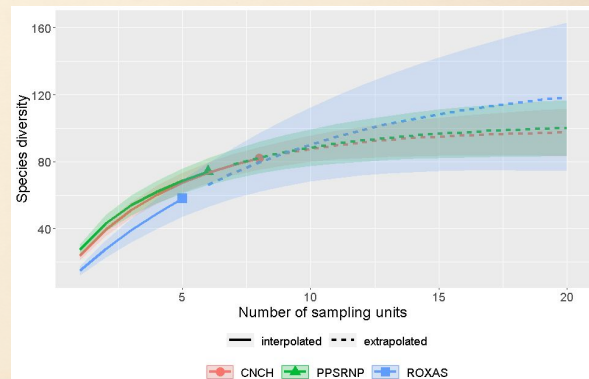

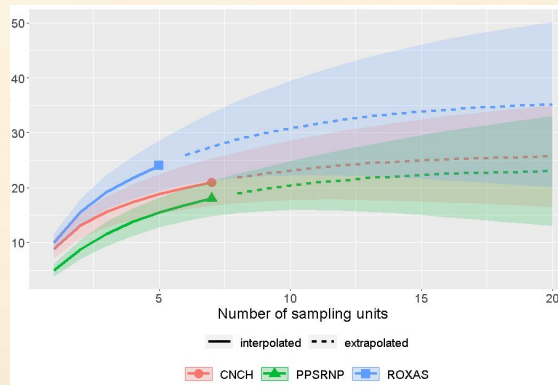

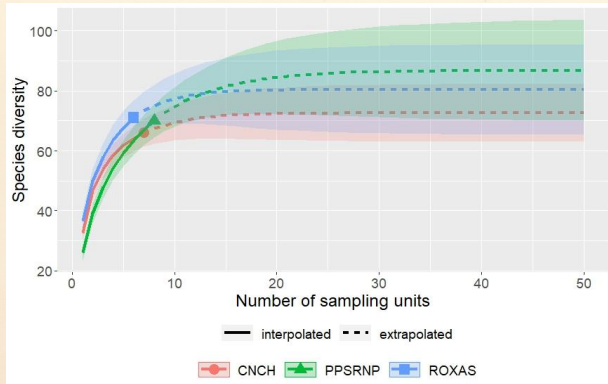

- Herpetofauna - 550 person-hours
- Mammals - 1,470 trap nights
- Birds - Length: 40 km, Width: 80 m
 - Area = 320 ha
- Flora - Length: 40km, Width: 40 m
 - Area = 160 ha

Result of Image when overlayed for interpretation/classification

- Makes it easier for the analyst to interpret and classify the image, will not need much adjusting when creating training polygons/data to fit pixels position. Hence, a well-done drone survey shortens the time for interpretation and fitting on the satellite imagery.

NAMRIA 2020 LC vs VAMR 2020 LC

Flowering/Fruiting Understory Vegetation

Puerto Princesa Subterranean River National Park (PPSRNP)

Marufinas - High percentage of crown defoliation and broken stems

Low elevation

High Elevation

Decrease in canopy cover

Understorey and ground cover vegetation underneath the fallen logs

Forest floor: Increase in leaf litter due to defoliation and dried epiphytes

Emergent trees were uprooted or broken from the buttress. Small to medium sized trees were broken in the middle.

Severe crown defoliation, broken stems, and significant decrease in canopy cover in PPSRNP

Q	Defoliation	Broken Stems	Number of Damaged Trees	Fruiting and Flowering Trees	Regenerants	Litter Depth	Fallen Logs or Uprooted Trees	Canopy Cover (Ave %)
0	1	1	1	3	65	4	0	82.66
1	2	2	8	0	35	8	5	39.11

Canopy Opening - Opportunistic species

Ixora palawanensis

Scrambling bamboos
(*Dinochloa* spp.)

Cleopatra's Needle Critical Habitat

Kalakwasan, Tanabag

Mangapin, Langogan

Kalakwasan, Tanabag - Landslides and uprooted Trees

The increase in water volume during the typhoon **uprooted most of the trees and exposed large rocks near the rivers and creeks** of Kalakawasan. The upland areas consist primarily of patches of old-growth and advanced secondary growth forests, but some portions were severely damaged due to **landslides**. Some landslides were proximal to **kaingin areas**.

Minor to moderate crown defoliation and broken stems, high number of uprooted trees in CNCH

Q	Defoliation	Broken Stems	Number of Damaged Trees	Fruiting and Flowering Trees	Regenerants	Litter Depth	Fallen Logs or Uprooted Trees	Canopy Cover (Ave %)
0	1	1	10	0	0	2	3	2.74 (Riverine)
1	2	2	5	0	0	2	9	3.83 (Riverine)
2	1	1	1	1	20	8	2	59.29
3	2	2	3	2	15	4	6	62.22
4	2	2	6	2	18	6	4	55.50
5	1	1	1	1	18	7	1	85.90
6	3	3	4	0	2	1	12	57.90
7	2	2	5	1	14	8	4	7.99
8	1	1	1	3	10	6	0	35.60

Slight

Moderate

Severe

Higher occurrence of herpetofauna near water bodies

Bird detection reduced with increased canopy openings as a result of damaged trees and defoliation

Palawan Frogmouth

Palawan Blue Flycatcher

Palawan Hornbill

Blue-naped Parrot

Is the observed dominance of insect bats in PPSRNP linked to low fruiting of defoliated trees?

70% species were insectivorous bats

90% individuals caught were insectivorous bats

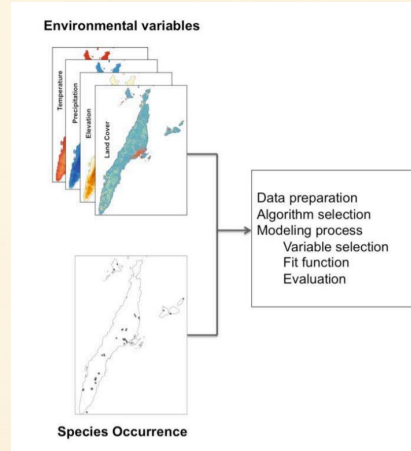

Did the effects of Typhoon Odette increase the population's vulnerability to zoonotic diseases?

Increase in dengue, malaria and swine fever in the recent months

Species distribution modeling was conducted to compare changes in suitable habitats before and after the typhoon.

Occurrence records for pre-odette scenario covering January 2020 to December 2021 (sourced from CCIPH, 2020; BMS records, and online repositories) and post-odette scenario from March to May 2022 (data collected during field survey)

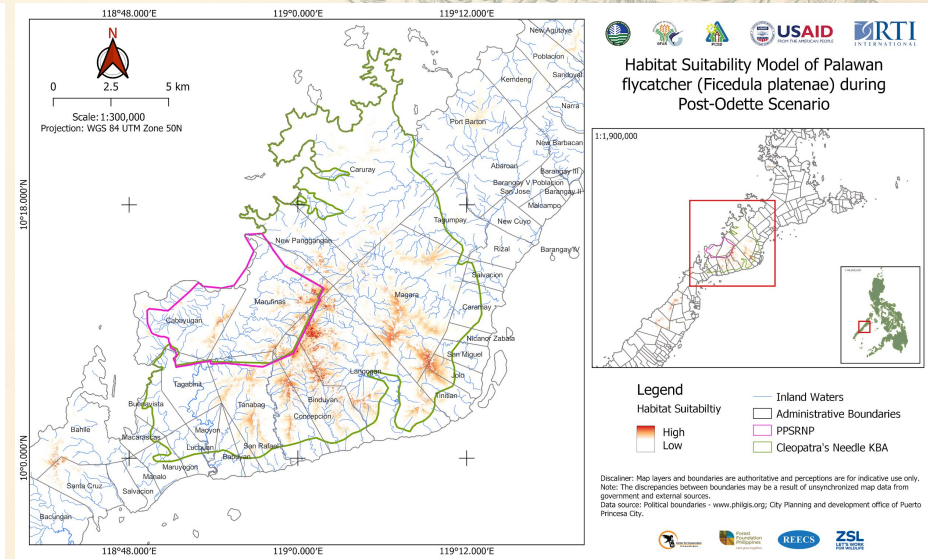

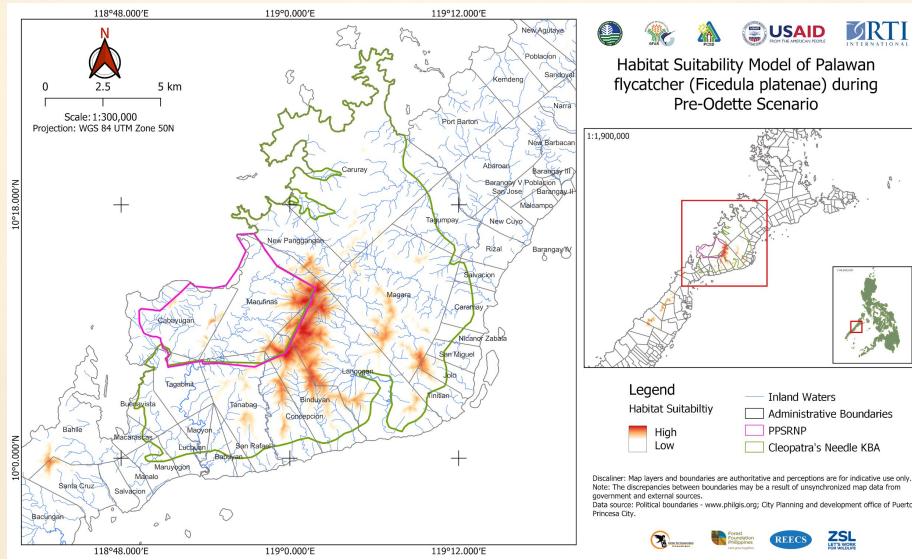

Environmental variables used included the vegetation index (NDVI) layers for 2021 and 2022, and elevation at 30x30 m resolution.

Model output per species. The results were then overlaid to create species congruence maps.

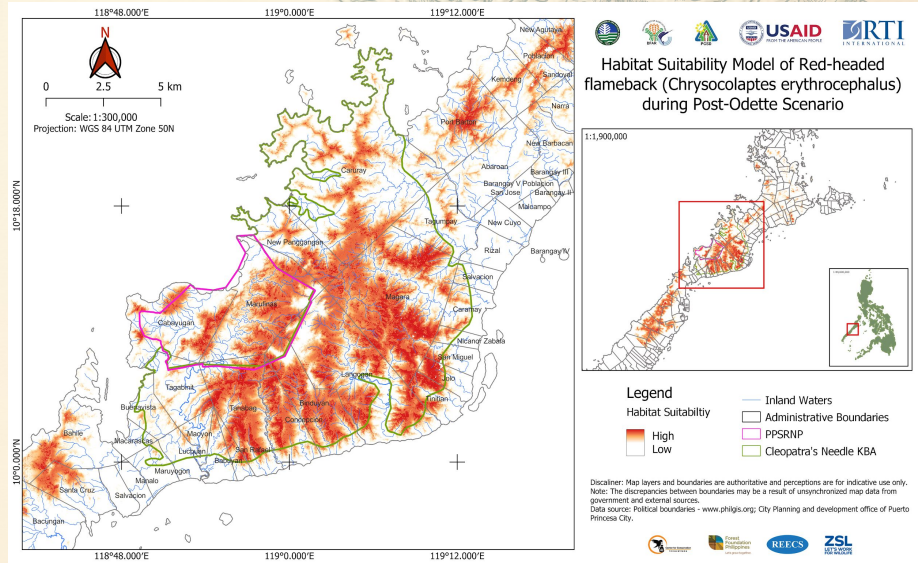

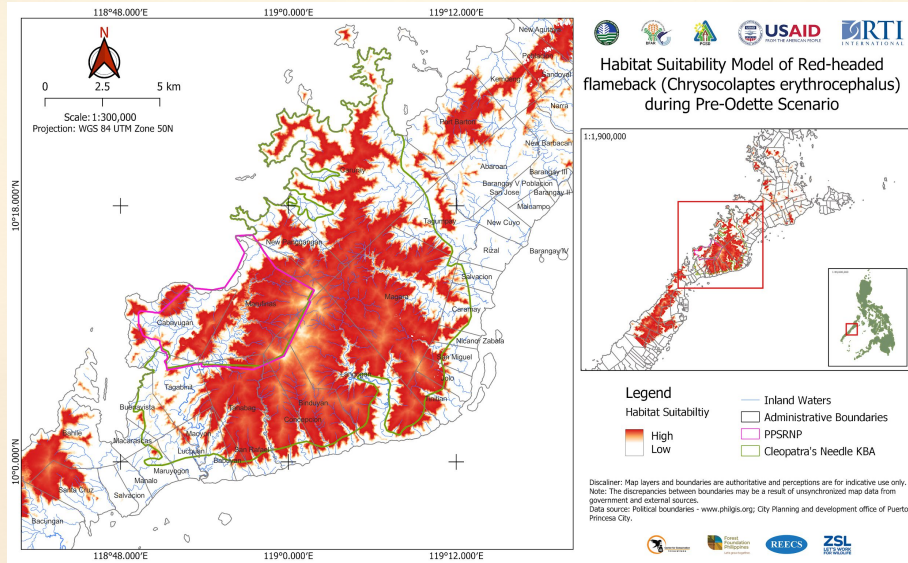

Habitat Suitability Model of Palawan Hornbill during Pre-Odette Scenario (2021) and Post Odette Scenario (2022)

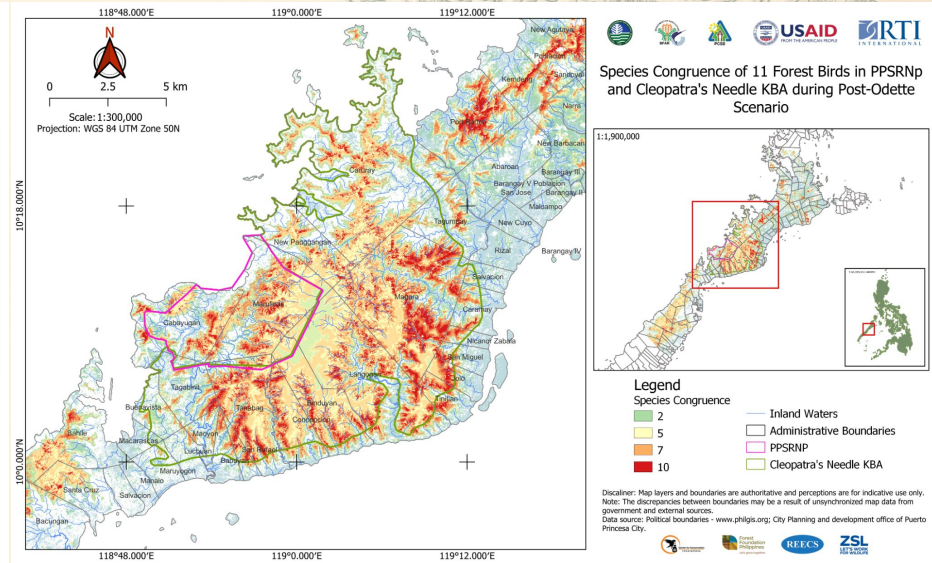

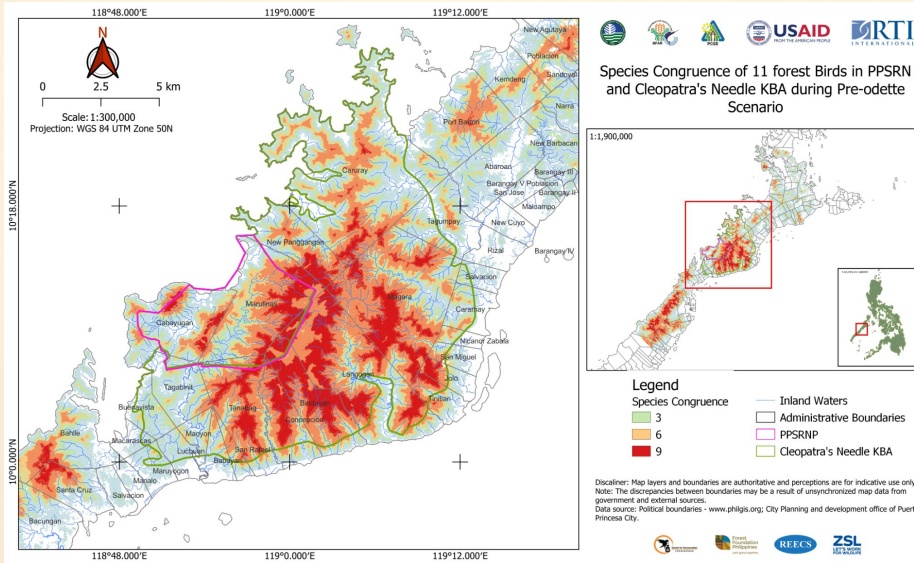

Habitat Suitability Model of Palawan Flycatcher during Pre-Odette Scenario (2021) and Post-Odette Scenario (2022)

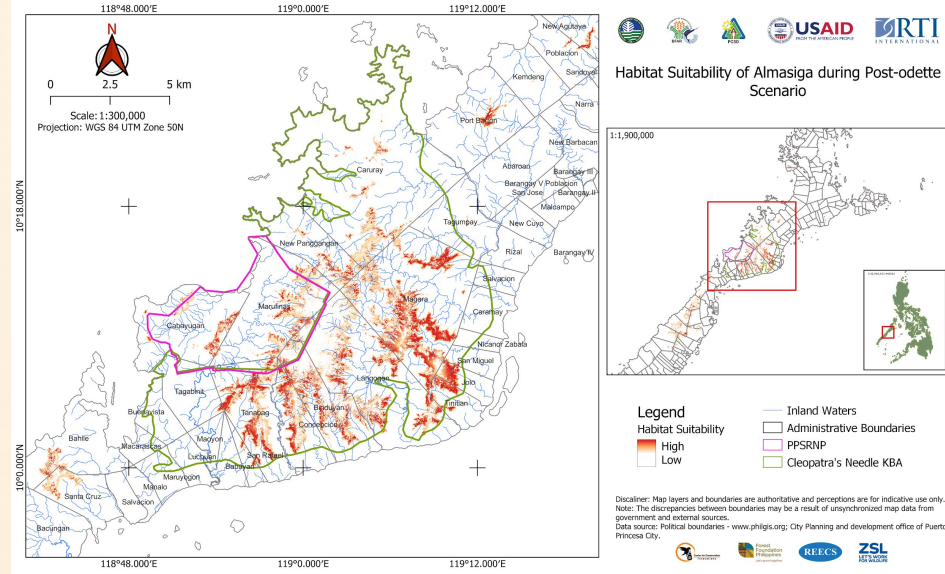

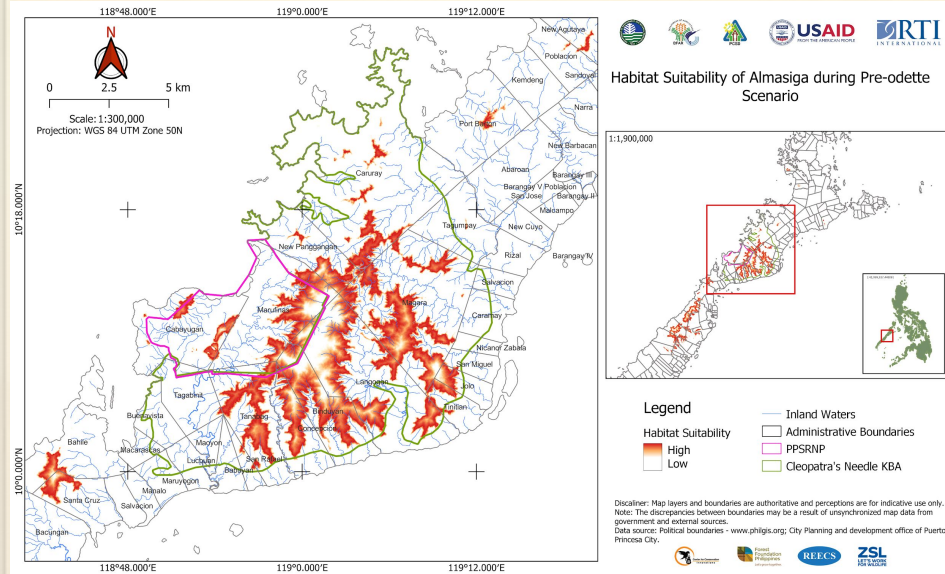

Habitat Suitability Model of Red-headed Flameback during Pre-Odette Scenario (2021) and Post-Odette Scenario (2022)

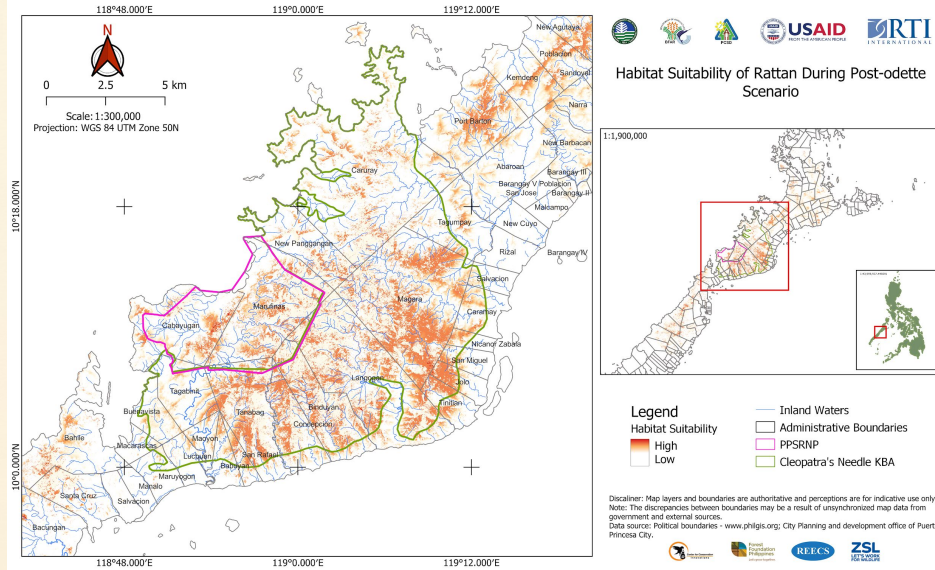

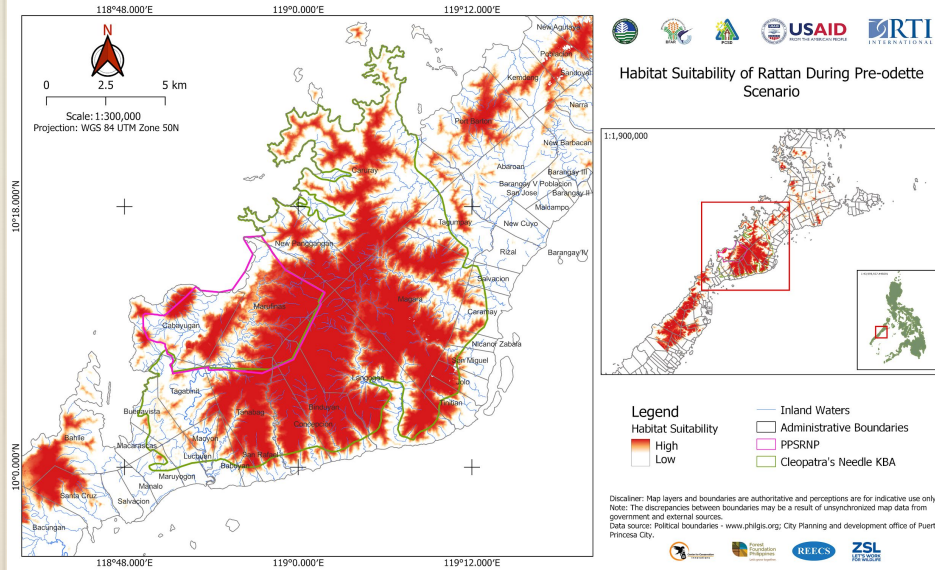

Species Congruence Species of 11 Forest Birds during Pre-Odette Scenario (2021) and Post-Odette Scenario (2022)

Habitat Suitability of *Almaciga* during Pre-Odette Scenario (2021) and Post-Odette Scenario (2022)

Habitat Suitability of Rattan during Pre-Odette Scenario (2021) and Post-Odette Scenario (2022)

Drivers of Land-use Change

Stage 3 - Analysis and Interpretation

Study of Land Use Change - Ground Assessment in P. Princessa

[Back](#)

Forest

- Clearing of debris also led to unregulated logging
- Insecure water supply
- Loss of NTFP areas
- Displacement of wildlife and humans
- Traditional ecological knowledge and practices set aside
- Customs, rituals, taboos and myths integral part of IP communities lost

Study of Land Use Change - Ground Assessment in P. Princesa

Back

Opening for
tourism

Challenges

- Artifact of sampling
 - Accessibility of sites (high number of uprooted trees)
 - Bad weather
 - Difficult field conditions (i.e. scarcity of drinking water)
- Data (GPS coordinates) for time series comparisons are unavailable. Only species lists are available.

Recommendations

- Consider habitat succession for forest recovery
- Prioritize clearing of debris and control of opportunistic species to ensure survival of regenerants
- Soil analysis in CNCH (water holding capacity, moisture, etc.)
- Revisit management zones of protected areas
