[illegible]

His drawings, we assume, describe structures, similar to several that previously had disappeared from his drawings as they were made.

5. *Subulnaria integrifolia* Torr.

**Abstract**—The purpose of this study was to determine the effect of a 12-week training program on the performance of a 1000-m swim time trial in a group of young swimmers. The subjects were 12 young swimmers (10 males and 2 females) with a mean age of 12.5 years. The subjects were divided into two groups: a control group and a training group. The control group did not receive any training, while the training group received a 12-week training program. The subjects performed a 1000-m swim time trial at the beginning and at the end of the 12-week period. The results showed that the training group had a significantly lower swim time than the control group at the end of the 12-week period. The results also showed that the training group had a significantly higher heart rate and oxygen consumption than the control group during the swim time trial. The results suggest that a 12-week training program can improve the performance of young swimmers in a 1000-m swim time trial.
